Questioning and predicting

What are you investigating? What question do you want to answer in your investigation?

What do you think will happen in your investigation and why? This is called a 'prediction'.

Explain why you have picked this investigation topic:

Show your question to your teacher. Do they approve of your investigation topic?

Teacher's initials

Planning and conducting your investigation

List the materials and equipment you will need for your investigation:

What are you going to do? List the steps of your investigation. Tip: Think about using numbers to label each step.

Describe how you will conduct a fair test. What will you change in your investigation? What will you keep the same? What will you measure?

Describe how you will conduct the investigation safely:

List the members of your team and explain what their roles in the investigation will be:

Investigation records

Draw a diagram or diagrams (with labels) of what your investigation looked like:

Write down what you observed during your investigation:

Did you take any measurements? If so, record them here:

Processing, modelling and analysing your results

Think of a way to present the results of your investigation (for example a table or a graph). Use the space below to present your results.

Evaluating your investigation

Compare your results to your prediction. Explain why you think your results were the same or different:

Do you think your investigation was a good way to test your question and prediction? Was it a fair test? Explain your answer.

Is there anything that you would do differently if you did this investigation again?

If you did the same experiment as another team how did your results compare to others?

Can you suggest any questions for further investigation?

From your results what is your answer (or conclusion) to your investigation's question and prediction?

Communicating your investigation

Tip: This is very important! Communicating well is essential for every science investigation.

Use your creativity. Try to make a video that is interesting and enjoyable for the viewer to watch and learn about your investigation. Create a storyboard of how you will communicate your investigation information in your video. All movies and TV programs use a storyboard to plan their show!

Use this page to plan your video presentation. Decide who in your team is going to speak in each section, what you are going to include in your video for each step and how you are going to do it. You may need a bigger piece of paper! Or use our storyboard planner.

What is the title of your investigation's video?

Your video needs to tell us all about your investigation and how you have followed all the steps for thinking like a scientist. Here are some ideas to help you. Tick the ones you have included.

Questioning and predicting – have you said

- The question that your investigation try will try to answer.
- What you think will happen (prediction).
- Your reason for your prediction?

Planning and conducting – have you said

- how you did your investigation.
- what you changed, what you kept the same, what you measured.
- Explained the materials and equipment you used and how you used them safely.
- Included photos that show how you did your investigation.
- Showed your observations and measurements.

Processing, modelling, analysing – have you

- Showed the images, tables, or graphs that you used to organise your results.
- Said what you observed with your data.
- Told about any patterns or relationships in your data that you can see.

Evaluating – have you said

- If your investigation answered your question and why or why not.
- Told if your prediction was correct – or not.
- Explained how your investigation could be improved if possible.
- Talked about any errors in your investigation.
- Discussed any other questions you could investigate resulting from your experiment.

Finally – Watch your video! This is very important.

When watching your video look out for the following things. You might like to hold a video show for your family and friends. Ask your viewers what they think about your video. Make sure you have lots of popcorn!

When watching your finished video –

- Can everyone be heard clearly?
- Is everyone speaking at the same speed?
- Are all team members looking at the camera?
- Is only one person talking at a time?
- Is there any background noise? **Tip:** If there is you may need to record again somewhere quieter.
- Is all text, photos, tables and graphs you show large enough for the viewer to see and read? And have you given your viewer enough time to look at them?
- Have you included any creative elements to make your video interesting?
- Is your video between 3 and 4 minutes long?

Have fun and we look forward to seeing your amazing investigations.
